WHERE IT GOES

This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Two rails 800 mm long, 480 mm apart (centres), on four legs 260 mm tall at the rail ends. Weld legs under the rails, square.

Two saddles 560 mm long across the rails, 500 mm apart (centres), welded on top of the rails. Top of the saddles 340 mm from the floor.

Chocks: four hardwood blocks 40 x 60 mm, inner faces 300 mm apart.

70 mm tall on the far saddle, 45 mm tall on the bung-end saddle, so the drum falls 2.9 degrees toward its bungs. Screw them down.

Fit: the drum body rests on the four inner top edges of the chocks, bung end low and over the tray. Nothing else holds it.

Loads: a drum full of water is about 240 kg; 691 N on each chock.

Check: frame stands level without rocking; the drum, rolled on, sits on all four chocks and does not roll off sideways.
