WHERE IT GOES
This part in colour, its neighbours in grey

HOW TO MAKE IT AND HOW IT FITS

Body: 12 mm plate 160 x 120 mm, standing across the drum end.
Drive shaft 16 mm in a 17 mm hole 20 mm up from the body's bottom edge; on it a 40 mm knurled wheel 8 mm wide that bears on the inside of the chime, and a 150 mm crank outside the body.
Guide roller 30 mm on a 12 mm axle, 53.5 mm above the drive shaft, runs on the outside of the chime: chime pinched between the two.
Cutter arm: 12 mm rod from a link block on the body, 12 degrees round from the top, carrying the 50 mm hardened wheel square to the head, 4 mm inside the chime wall. An M12 clamp screw presses it into the head; a 1.5 mm cover sits over the wheel.
Torque arm: 30 x 8 mm flat, riser 88 mm, then 170 mm to the post.
Check: on a drum the wheel cuts the head just inside the chime; the torque arm rests on the post as the crank turns.
